

Supplemental Material: Synthesis and Completion of Facades from Satellite Imagery

Xiaowei Zhang, Christopher May, Daniel Aliaga
Purdue University, USA

Supplemental Figure 1: *Example Facades.* We show satellite façade images and our synthesized facades in alternating rows.

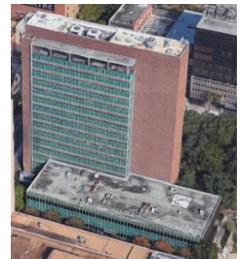

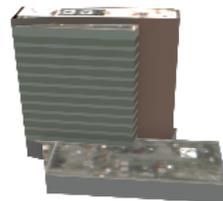

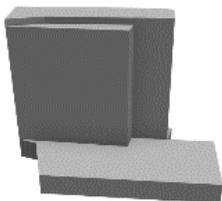

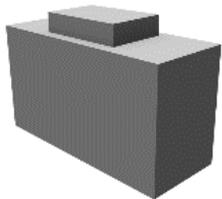

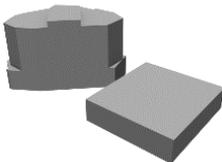

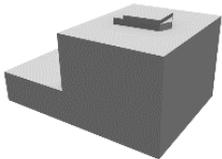

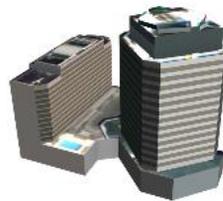

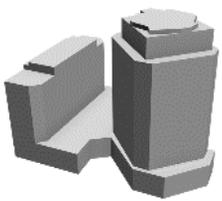

Supplemental Figure 2: *Segmentation Qualitative Comparison.* a) Original facades. b) to g) are corresponding to segmentation from Pix2Pix_256, Pix2Pix_128, Pix2Pix_96, Pix2Pix_64, DeepLab v3+ and EncNet respectively. h) Manually created segmentation ground truth.

Supplemental Table 1: *Segmentation Models.* We show configuration details for the segmentation models we trained from scratch.

Models	Input	Output	Generator/BackBone	Discriminator	Batch Size	Training Time
Pix2Pix_256	256x256	256x256	UNET_256	70x70 PatchGAN	1	2 hours
Pix2Pix_128	128x128	128x128	resnet_6blocks	70x70 PatchGAN	1	2 hours
Pix2Pix_96	96x96	96x96	resnet_6blocks	34x34 PatchGAN	1	2 hours
Pix2Pix_64	64x64	64x64	resnet_6blocks	34x34 PatchGAN	1	2 hours
DeepLab v3+	286x286	286x286	xception_65	–	4	1 day
EncNet	286x286	286x286	resnet101	–	4	1 day

Our synthetic buildings rendered within Google Earth.

syn. building

proj. tex map

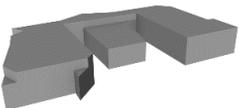

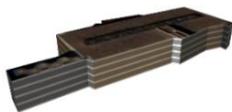

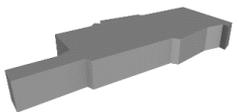

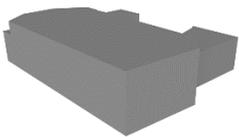

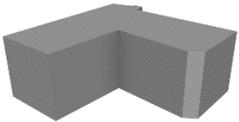

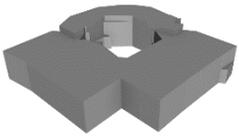

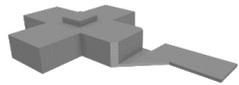

syn. facades

Google Earth comparison

Supplemental Figure 3a: Buildings. We show additional results of Area A1 and some building close-ups. Please note that the Google Earth comparison is *not* the input imagery – they are aerial images captured at much higher resolution and with the building facades at a much more head-on viewing angle.
